

## RATES OF CONVERSION

To compare a single country's real GDP over a period of years, it is necessary to remove any movements that are due to price changes. In the same way, in order to compare the real GDPs of a group of countries at a single point in time, it is necessary to remove any differences in their GDPs that are due to differences in their price levels. Price indices are used to remove the effects of price changes in a single country over time; purchasing power parities (PPPs) are used to remove the effects of the different levels of prices within a group of countries at a point in time.

### Definition

PPPs are currency converters that equalise price levels between countries. The PPPs shown here have been calculated by comparing the prices in OECD countries of a common basket of about 2 500 goods and services. Countries are not required to price all the items in the common basket because some of the items may be hard to find in certain countries. However, the common basket has been drawn up in such a way that each country can find prices for a wide range of the goods and services that are representative of their markets.

The goods and services to be priced cover all those that enter into final expenditure – household consumption, government services, capital formation and net exports. Prices for the different items are weighted by their shares in total final expenditures to obtain the PPPs for GDP shown here.

### Comparability

The PPPs shown here have been calculated jointly by the OECD and Eurostat using standard procedures. In consultation with their member countries, OECD and Eurostat keep their methodology under review and improvements are made regularly.

### Overview

Over the period 1995-2008, there were significant differences between changes in PPPs and changes in market exchange rates. Even when the two indicators moved in the same direction, changes differed in their magnitude – as illustrated by the experience of Ireland and the Czech Republic.

Market exchange rates are sometimes used to convert the GDP in different currencies to a common currency. However, comparisons of GDP based on exchange rates do not reflect the real volumes of goods and services in the GDP of the countries being compared. For many of the low-income countries, for example, the differences between GDP converted using market exchange rates and GDP converted using PPPs are considerable. For Turkey and Mexico, the difference between GDP estimates for 2008 based on either PPPs or market exchange rate is over 35%. For India the difference is above 180%. In general, the use of market exchange rates understates the real GDP of low-income countries and overstates the real GDP of high-income countries.

Price level indices are the PPPs estimates for 2008 divided by market exchange rates for the same year, with the OECD set equal to 100. In general, there is a positive correlation between GDP levels and price levels.

Denmark, Norway and Switzerland, three of the OECD countries with the highest per capita income, also recorded the highest price levels in 2008, exceeding the OECD level by 40% or more, while India had a price levels of around 35% of the OECD average.
